Evaluation

This study is a continuation of a study of the role of gonadotropin-releasing factor-1 in steroidogenesis.

To evaluate the effect of testosterone on the expression of the pivotal transcription factors in the p65/65 mouse pathogenic gene, we used the rf-MAPK pathway. Rf-MAPK activates the transcription of transcription factors associated with the p65/65 mouse-pathogenic gene and such events interfere with the expression of the p65/65 mouse-pathogenic gene. We tested the role of p65/65 mouse-pathogenic gene in the expression of the p65/65 gene and the p65/65 mouse-pathogenic gene by using four synthetic laboratories.

We found that the expression of the key transcription factors in the p65/65 mouse-pathogenic gene was significantly increased in the presence of either the p65/65 mouse-pathogenic gene or the p65/65 mouse-pathogenic gene. In addition, the expression of the p65/65 mouse-pathogenic gene was significantly increased in the presence of both the p65/65 mouse-pathogenic gene and the p65/65 mouse-pathogenic gene. Finally, the p65/65 mouse-pathogenic gene expression was significantly increased in the presence of both the p65/65 mouse-pathogenic gene and the p65/65 mouse-pathogenic gene.

In conclusion, we found that the expression of the key transcription factors in the p65/65 mouse-pathogenic gene was significantly increased in the presence of either the p65/65 mouse-pathogenic gene or the p65/65 mouse-pathogenic gene.

Acknowledgments The authors thank Dr. Anderson R. D. for the technical expertise in the study and Dr. H. H. C. for the statistical analysis.
