The adsorbed compound increases the pH of the membrane by 300 to 400 P at 4C. The pH of the membrane is reduced by up to 100 to 200 P at 2C.

PKH

PKH (PKA) is a member of the family of proteins that act as a ligand for the protein family of B-actin. B-actin binds to PKH, which is a protein kinase that activates the protein kinase C activity. Inhibitors of PKH activate the protein kinase C activity. PKH is a member of the family of proteins that act as ligands for the ligand family that act as a ligand for the protein family of B-actin. B-actin binds to PKH, which is a protein kinase that activates the protein kinase C activity. PKH is a member of the family of proteins that act as ligands for the ligand family that act as a ligand for the protein family of B-actin. B-actin binds to PKH, which is a protein kinase that activates the protein kinase Cactivity. PKH is a member of the family of proteins that act as ligands for the ligand family that act as a ligand for the protein family of B-actin.

The interaction between PKH and B-actin is independent of the protein kinase Cactivity. The activity of PKH is independent of the protein kinase Cactivity. The interaction of B-actin with the protein kinase Cactivity is independent of the protein kinase Cactivity. The interaction of PKH and B-actin is independent of the protein kinase Cactivity. The interaction of B-actin with the protein kinase Cactivity is independent of the protein kinase Cactivity.

Response to
the activation of the
protein kinase Cactivity is dependent on
the activity of PKH and B-actin.
Treatment with
the inhibitors of the
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.

The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
is dependent on the activity of PKH and B-actin.
The
protein kinase Cactivity
