

## 1 Title

The Koryo Robo's head and body are built around a base with a functional microprocessor by Oda's company. In the next generation of Koryo Robots, Oda's company will be concentrating on the development of Koryo Robot. The Koryo Robotic will be able to generate and process a large number of biological samples from human and animal tissues. The Koryo Robotic's DNA will be used to reinforce the human immune system. The Koryo Robo's DNA will be used to detect and field-test human pathogens. The Koryo Robo's DNA can be used to detect and test microorganisms and vaccines. Oda's new Koryo Robot will be able to detect and field test human pathogens.
