To determine whether the presence of estrogen-associated protein kinase inhibitors (ERKs) during the development of *Toxoplasma gondii* infection leads to a priori cytotoxicity of *Toxoplasma gondii* in vitro, we conducted a double blind, independent, randomized, double blind, placebo controlled, double blind, and double blinded, double blinded, control group study. Ten healthy, non-*Toxoplasma gondii*-infected volunteers (mean age, 62.5 ± 6.3 years) who were randomly selected into the control group (*Toxoplasma p. epithelial* cells were harvested at a normal rate and separated into two equal sections) and two randomly selected *Toxoplasma p. cell* lines were used. *Toxoplasma p. epithelial* cell cultures were harvested by centrifugation at 3700g for 30 min at 5°C and stained with antibodies against *Toxoplasma p. epithelial* cells (see Methods).

Mean of *Toxoplasma gondii* infection was 40

*Toxoplasma p. epithelial* cells were harvested by centrifugation at 3700g for 30 min at 5°C and stained with antibodies against *Toxoplasma p. epithelial* cells (see Methods).

Serum Toxoplasmosis

Serum Toxoplasmosis was induced by blocking of the *Toxoplasma* adenovirus (TPA) (10). TPA was not detected in *Toxoplasma gondii* infection but by comparison with *Toxoplasma p. epithelial* cells the TPA-associated protein kinase inhibitor (ERKs) significantly inhibited *Toxoplasma gondii* infection in vitro and in vivo.

*Toxoplasma* adenovirus (TPA) and *Toxoplasma p. epithelial* cells were transfected with TPA-associated protein kinase inhibitors (ERKs) and TPA-associated protein kinase inhibitors (ERKs) and TPA-associated protein kinase inhibitors (ERKs) (see Methods).

Immunofluorescence images of *Toxoplasma p. epithelial* cells

Immunofluorescence images of *Toxoplasma p. epithelial* cells were collected by cupping the surface of TPA-associated protein kinase inhibitor (ERKs) (see Methods).

Toxoplasmosis was induced by blocking of TPA-associated protein kinase inhibitor (ERKs) (see Methods).

Serum Toxoplasmosis

Serum Toxoplasmosis was induced by blocking of the *Toxoplasma* adenovirus (TPA) (10). TPA was not detected in *Toxoplasma gondii* infection but by comparison with *Toxoplasma p. epithelial* cells the TPA-associated protein kinase inhibitor (ERKs) significantly inhibited *Toxoplasma gondii* infection in vitro and in vivo.

Toxoplasmosis was induced by blocking of TPA-associated protein kinase inhibitor (ERKs) (see Methods).

Toxoplasmosis was induced by blocking of TPA-associated protein kinase inhibitor (ERKs) (see Methods).

Serum Toxoplasmosis was induced by blocking of TPA-associated protein kinase inhibitor (ERKs) (see Methods).

Toxoplasmosis was induced by blocking of TPA-associated protein kinase inhibitor (ERKs) (see Methods).

Toxoplasmosis was induced by blocking of TPA-associated protein kinase inhibitor (ERKs) (see Methods).

#### Statistical Analysis

Toxoplasmosis was induced by blocking of TPA-associated protein kinase inhibitor (ERKs), TPA (10), TPA-associated protein kinase inhibitor (ERKs), TPA-associated protein kinase inhibitor (ERKs) (see Methods), TPA-associated protein kinase inhibitor (ERKs), and TPA-associated protein kinase inhibitor (ERKs) (see Methods).
