A selection of 12 studies in a multi-disciplinary field of biological sciences have shown that estrogen-related alterations in the rat estrogen receptor gene are involved in the pathogenesis of breast cancer in vivo.

The previous studies have demonstrated that the estrogen receptor gene, TRCA1, is involved in estrogen-related changes in the breast cancer cell line tumorigenesis. This understanding of the role of the TRCA1 gene targeted for estrogen modulation is important for future research on the role of the TRCA1 gene in breast cancer.

TRCA1 is a key regulator of cell cycle progression and differentiation. Its role in breast cancer stem cell biology and cancer regulation is well established.

TRCA1 is a key regulator of cell cycle progression and differentiation.

TRCA1 is a key regulator of cell cycle progression and differentiation.

TRCA1 is a key regulator of cell cycle progression and differentiation.

Numerous studies in the past decade have shown that estrogen-related changes in the breast cancer cell line tumorigenesis are involved in the pathogenesis of breast cancer.

The role of TRCA1 in breast cancer stem cell biology and cancer regulation is well established.

The role of TRCA1 in breast cancer stem cell biology and cancer regulation is well established.

TRCA1 is a key regulator of cell cycle progression and differentiation.

TRCA1 is a key regulator of cell cycle progression and differentiation.

TRCA1 is inactivated by estrogen.

TRCA1 is also involved in breast cancer stem cell biology and cancer regulation.
