Bakker-Akt and Tarb-Bkt (PST) in vitro. To examine whether these drugs could inhibit MMP-1 expression, we incubated BAKK-Akt at room temperature for 4 h and confirmed that the inhibitory effect of BAKK-Akt was transiently and was abolished with the addition of THF, and that BAKK-Akt failed to inhibit MMP-1 expression in vitro. Inhibition of MMP-1 expression in the absence of BAKK-Akt resulted in the suppression of MMP-1 expression in the absence of BAKK-Akt. These results indicate that BAKK-Akt could inhibit MMP-1 expression in vitro.

Bakker-Akt

BAKK-Akt regulates transcription

BAKK-Akt interacts with the cell-surface

Inhibition of MMP-1 expression is thought to mediate the regulation of the transcription factors that are required for cell survival and survival

The TGF- response is a common regulator of MMP-1 expression

The TGF- response is a common regulator of MMP-1 expression

Inhibiting MMP-1 expression in vitro inhibits MMP-1 expression and

The inhibition of MMP-1 expression in vitro inhibits MMP-1 expression and

breathes out MMP-1 expression in vitro.

Previous studies showed that BAKKAkt interacts with the cell surface

BAKKAkt regulates the cell surface

BAKKAkt interacts with the cell surface BAKKAkt interacts with the cell surface

BAKKAkt interacts with the cell surface

BAKKAkt interacts with the cell surface

BAKKAkt interacts with the cell surface

BAKKAkt interacts with the cell surface

BAKKAkt interacts with the cell surface

BAKKAkt interacts with the cell surface

BAKKAkt interacts with the cell surface

BAKKAkt interacts with the cell surface **BAKK**
